

A i r m o v i n g

Operating principle

Two symmetrical rotors convolute in opposite directions. The medium to be conveyed flows into the housing surrounding the rotors, and is displaced in a positive manner from the inlet to the discharge side via the chambers formed between the rotors and the housing. At the very moment the rotor tip clears the edge of the pre-inlet channel, the volume of the gas displaced is compressed by the backflow of the pressurized gas present in the conveying piping at the discharge socket. The final pressure automatically adjusts itself to the pressure level in the downstream piping and components. The flow required to convey all types of gases under various operating conditions can be calculated once specific blower data are known. Each rotor revolution results in the displacement and compression of the so-called scoop volume q_0 (litre/revolution). The scoop volume shows a constant for each blower size. This results in the theoretical capacity

$$Q_0 = \frac{n \cdot q_0}{1000} \text{ (m}^3\text{/min.)}$$

The actual capacity is obtained by deducting the amount of gas Q_v slipping back through the clearances from the theoretical capacity:

$$Q_1 = Q_0 - Q_v \text{ (m}^3\text{/min.)}$$

The amount of slippage through the clearances depends on the density of the gas at the inlet, the differential pressure Δp and the total area F of the clearances.

The volumetric efficiency is

$$\eta_v = \frac{Q_1}{Q_0} = 1 - \frac{Q_v}{Q_0}$$

Since the rotor clearances are kept to a minimum, efficiency under operating conditions is highly favourable. The output volume varies very slightly with changes in load (see page 4).

The power required to compress the flow at inlet conditions is, theoretically:

$$P_{th} = \frac{Q_0 \cdot \Delta p}{600}$$

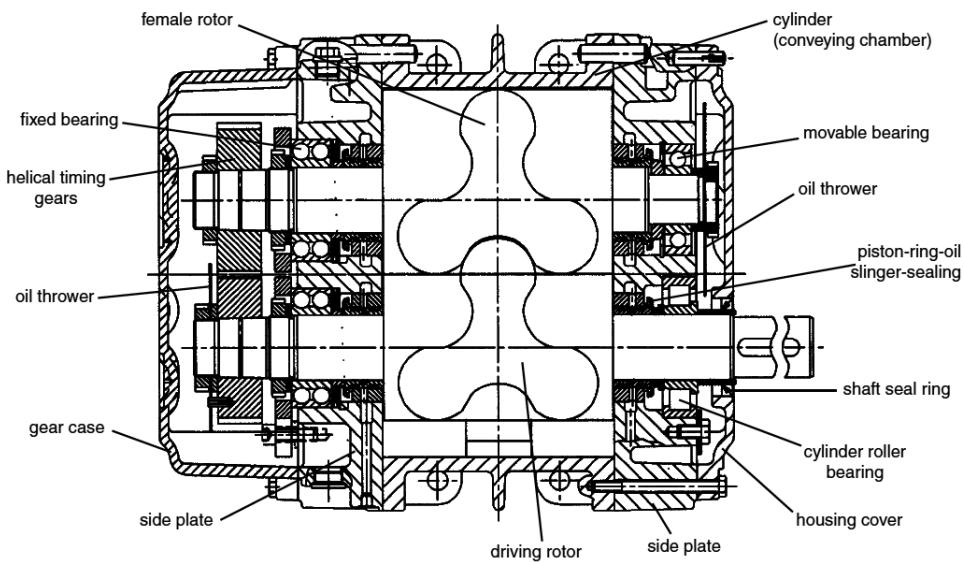

This power must be increased to compensate for the mechanical friction in the bearings, timing gears, seal components, as well as in the dynamic losses occurring in the blower nozzles and the conveying chamber.

The power required at the blower coupling is:

$$P_k = P_{th} + P_v \text{ (kW)}$$

The main component i.e. the theoretical power for compression, is thus independent of the type of gas involved, and directly proportional to both the operating pressure differential and the blower speed. Since no internal compression takes place, the power absorbed when operating without load is nearly equal to the power loss P_v . This represents approximately 3 to 5 % of the full load power rating transmitted via the coupling.

Due to the sum of all manufacturing tolerances, power consumption and intake volume flow can show a tolerance of ± 5 %.

Sectional view of the blower RL ...

Design and construction

Emmecom positive displacement blowers are twin shaft rotary machines. The two rotors are placed axially parallel to each other and centered within the housing. Timing gears ensure that the rotors revolve without making contact. The rotors are supported on ball and roller bearings. In order to achieve a high efficiency the clearance between the rotors is kept to a minimum and is based on the pressure differential and thermal load expected under operating conditions. In case of larger blowers the roller bearing clearances and the shaft deflection have an influence on the clearance. Larger clearances between the rotors and the end plates compensate for axial thermal expansion at the floating bearing end.

Rotors

The rotors are dynamically balanced. Smaller blowers of the sizes RL1030 - RL1080 feature steel rotors and shafts (C 45 N), drop-forged in one single piece. Sizes RL1900 and larger are constructed with pistons made of modular cast iron and steel shafts (C 45 N). Where contamination particles are likely to accumulate during operation, the cavities of the cast iron rotors are capped.

Housing

The housings are made of high quality grey cast iron (GG 20). **The blower housing requires no additional cooling, even at high loads.** Up to the size RL1800, the blower feet are bolted on.

Timing gears

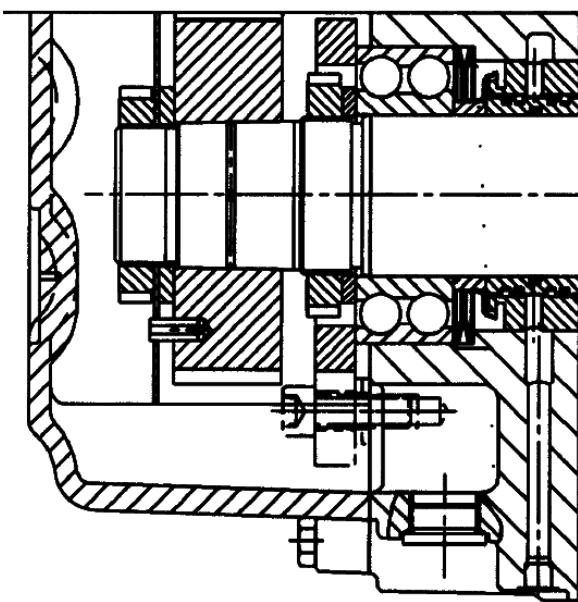

The helical timing gears are tempered, and then ground to an exacting degree of precision. The positioning and fastening of the gears onto the shafts takes place via taper interference fit, guaranteeing both excellent concentricity and reliable adherence.

Special materials

Non-standard materials such as nodular graphite cast iron (GGG 40), cast steel (GS - C 25) and CrNi - cast steel are available for special applications. Special requirements, however, must be clarified with the manufacturer in advance!

Sealing configuration, serie RL

These models are designed to convey air or neutral gases. The conveying chamber is sealed from the oil chambers by means of an oil slinger in conjunction with piston ring labyrinth type seals featuring a generously dimensioned central vent chamber (condensate channel), and which plays a crucial role in ensuring that the medium conveyed remains clean and oil-free. The drive shaft is sealed by means of a radial seal ring installed in the housing cover.

Special designs:

Double oil-purged radial seal rings at gas conveying. Double-oil-purged radial seal rings with shaft sleeve and air-cooled seal ring housing (from profile 18 cooling water channel) are used in high vacuum designs. A double-acting mechanical seal with a seal oil circulation system for applications involving pressure-tight housings rated for static internal pressures of up to 25 bar.

Sealing configuration, gas blower series GRa, GRb and GR

These models feature bearing housings which are outboard of the conveying chamber. The four shaft passages at the conveying chamber are sealed from atmosphere by means of double-acting mechanical seals, which are either water- or oil-purged and cooled, or by labyrinth type packing. These machines are also available with soft packing seals.

Sealing configuration, gas blower series GQ

The four shaft passages at the conveying chamber are sealed by means of special mechanical seals.

Lubrication

Positive Displacement Blowers are splash lubricated. The oil thrower discs and timing gears carry the lubricant to the ball and roller bearings. In special cases where splash lubrication is inadequate as a result of high operating speeds or operating temperatures requiring oil cooling, or where an oil recirculation system is required in conjunction with oil-cooled mechanical seals, a central forced oil lubrication system is supplied (refer to the operating instructions for oil grades).

DIMENSIONI D'INGOMBRO GRUPPI RL_KC

RL_KC SERIES OVERALL DIMENSIONS

- 1 gruppo sofflante a lobi / *positive displacement blower*
 - 2 motore elettrico / *electric motor*
 - 4 piedini antivibranti / *anti-vibration mountings*
 - 7 trasmissione a cinghie / *belt drive*
 - 8 protezione delle cinghie (solo per l'installazione senza cabina di insonorizzazione) / *belt guard (only in case of installation without acoustic hood)*
 - 14 manicotto elastico lato aspirazione (extra prezzo) / *flexible pipe connection suction side (extra price)*
 - 16 manicotto elastico lato mandata / *flexible connection discharge side*
 - 18 valvola di sovrappressione / *pressure relief valve*

- 21 dispositivo per avviamento senza carico (accessorio) /
start-up unloading device (accessory)
 - 28 supporto motore incernierato / *hinged motor plate*
 - 30 basamento / *base frame*
 - 31 filtro silenziatore / *filter silencer*
 - 33 raccordo con valvola di non ritorno integrata /
connection housing with integrated non-return valve
 - 50 cabina di insonorizzazione / *acoustic hood*
 - 51 ventola / *fan*
 - 71 manometro (accessorio) / *pressure gauge (accessory)*
 - 75 indicatore di manutenzione filtro (accessorio) /
maintenance indicator (accessory)
